

Murmure. Your local voice desk.

Everything you need to install, configure, dictate, edit, personalize, recover, and troubleshoot Murmure 0.1.25.

Quick when you need it. Complete when you want it.

Read pages 3 through 6 to start dictating. Keep the rest as a reference for every feature and recovery path.

16 Troubleshooting and reference

Two companion formats. The eight-slide Canva deck is the fast introduction. This manual contains the complete operating instructions.

Start with the right Mac and the right file.

● Apple Silicon

M1 or newer. The current shared app does not run on Intel Macs.

● macOS 26 or later

The modern speech and on-device model APIs require macOS 26+.

Install the shared archive

- 01** Download **Murmure.app.zip** from the GitHub release link your friend shares with you.
- 02** Double-click the ZIP, then drag **Murmure.app** into the Applications folder.
- 03** Open Applications. Control-click Murmure, choose **Open**, then confirm.
- 04** If macOS still blocks it, open **System Settings > Privacy & Security** and choose **Open Anyway**.
- 05** Keep only one installed copy in Applications. Do not run the app from Downloads or an external build folder.

Why the warning? Friend builds may be locally signed but not notarized through Apple's paid distribution service. The warning does not mean Murmure sends your audio anywhere.

Intel compatibility is still a separate hardware investigation. Do not bypass the requirements shown above.

Complete all eight setup steps.

The Continue button stays unavailable until the required proof for that step is complete.

- 01 Display language.** Choose English, Français, or Español for Murmure's menus, buttons, and instructions.
- 02 Private by design.** Review where data lives and the two network exceptions.
- 03 Microphone.** Request access so Murmure can hear recordings.
- 04 Accessibility.** Open macOS settings and grant access so the global shortcut and text insertion work.
- 05 Shortcut.** Choose a physical key and one of the three gestures.
- 06 Microphone test.** Choose an input, start the meter, speak, and stop the test.
- 07 Language you speak.** Keep Automatic for multilingual recognition or choose an explicit language hint.
- 08 Test dictation.** Record a short sentence, finish it, then acknowledge the completed test.

Microphone access

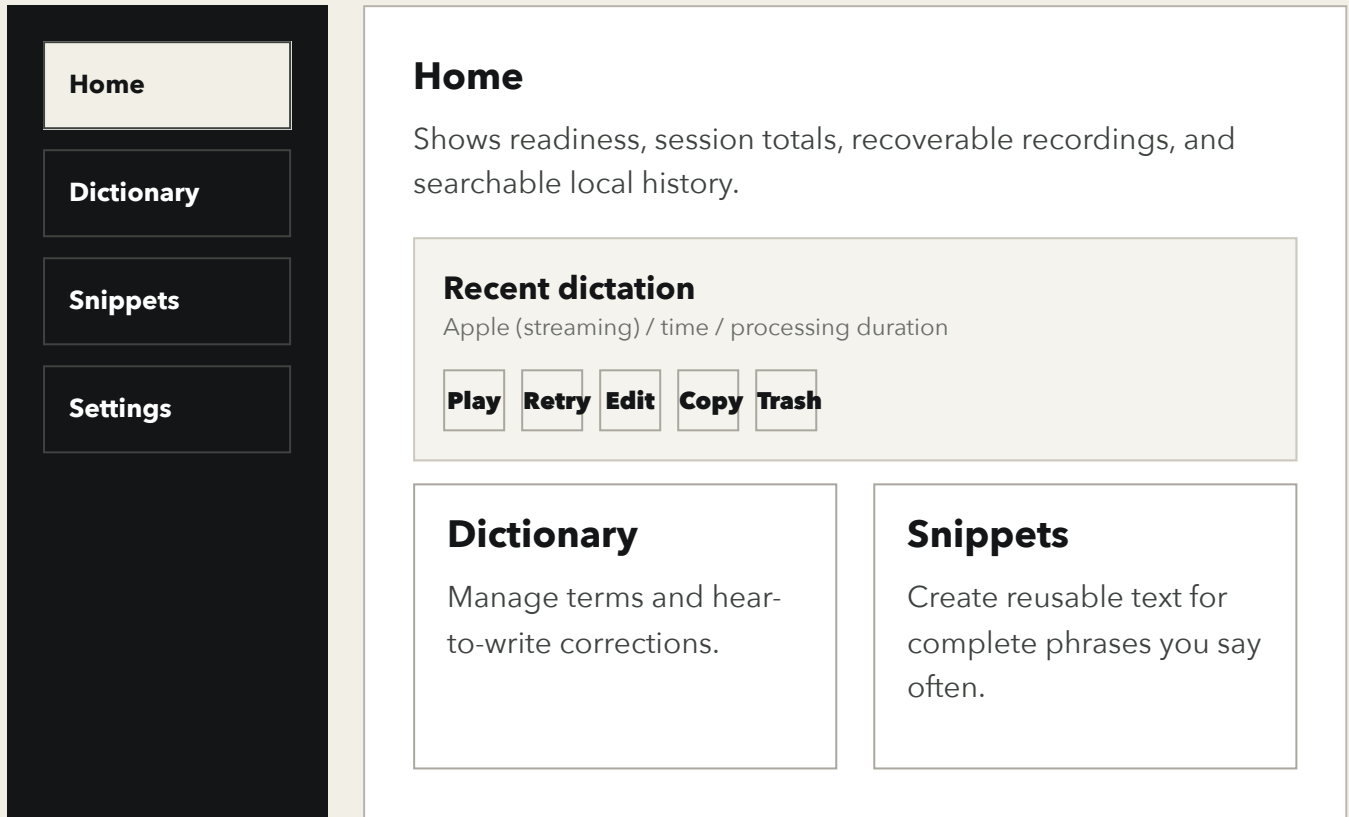

Lets Murmure capture audio. macOS owns this permission.

Accessibility access

Lets the global shortcut work and inserts finished text into the app you were using.

Changed a permission? Quit and reopen Murmure after macOS shows the grant. You can rerun the whole setup later from Settings.

Four destinations. One local workflow.

Settings is grouped by task

Dictation / Shortcuts / Microphone & sounds

Configure how speech starts, what engine listens, and which input is used.

Appearance / Privacy & storage / Advanced & updates

Choose the display language, review local data, run diagnostics, or update Murmure.

One category at a time. Settings keeps its category list visible and shows only the selected category's controls. Home still provides the large Record control for setup and testing.

Cursor. Shortcut. Voice. Text.

01

Place the cursor

Click the exact editable field in Mail, Notes, Messages, a browser, or another Mac app.

02

Start recording

Use your selected key and gesture. Speak normally, including pauses.

03

Finish

With While I'm speaking enabled, words appear at the cursor as you talk. On release, Murmure finishes and cleans the result.

What happens after you finish

Audio > **Speech engine** > **Cleanup** > **Snippet** > **Dictionary** >

History + insertion

Focus matters. Leave the destination field focused while Murmure finishes. Compare Mode is the exception: it shows engine results instead of typing anything.

Choose when text appears. In Settings > Dictation, select While I'm speaking for live text at the cursor, or After I finish for one final insertion.

Choose the physical behavior that fits your desk.

Hold

Press and hold to record. Release to finish. Best for short dictation and the default  workflow.

Double-tap and hold

Tap once, then press and hold within the short timing window. Release to finish.

Press to start/stop

Press once to begin and press again to finish. Useful when holding a key is uncomfortable.

Hands-free dictation

Open **Settings > Shortcuts**, enable hands-free, and choose a shortcut that is different from push-to-talk and Command Mode.

Press hands-free key

Speak without holding

Same key or Enter finishes

Finish

Press the same hands-free key or press Enter.

Cancel

Press Escape while the hands-free session is active.

Shortcut safety. Murmure rejects duplicate shortcuts, bare ordinary keys, and common macOS-reserved combinations. Right Option may act as AltGr on international keyboard layouts.

Use Restore shortcut defaults if custom bindings become confusing.

Two local engines with different strengths.

APPLE STREAMING

Text while you speak

- Runs through Apple's Speech framework.
- Can write live transcript updates into the focused field.
- Final cleanup replaces the live draft after release.
- Uses an explicit language hint.
- Best when you want immediate feedback.

PARAKEET BATCH

Text after release

- Runs locally through FluidAudio and Core ML.
- Transcribes after the recording finishes.
- Provides Automatic recognition for 25 languages.
- May download about 470 MB on first use.
- Best for multilingual automatic recognition.

Compare both local engines

Compare Mode runs both engines on one recording and opens a side-by-side result window. It deliberately does **not** type either result into the focused app.

Timing caution. Treat the comparison as a quality review, not a universal speed ranking. Engine timing begins after different preparation stages.

What you see and what you speak are separate.

Language you speak

In **Settings > Dictation**, Automatic selects Parakeet and recognizes supported languages as you speak. Choose an explicit language only when you want a decoder hint.

Display language

In **Settings > Appearance**, choose English, Français, or Español for menus, buttons, and instructions. This never changes the language you dictate.

Automatic supports these 25 languages

Bulgarian	Croatian	Czech
Danish	Dutch	English
Estonian	Finnish	French
German	Greek	Hungarian
Italian	Latvian	Lithuanian
Maltese	Polish	Portuguese
Romanian	Russian	Slovak
Slovenian	Spanish	Swedish
Ukrainian		

Cleanup behavior

English, Spanish, and French have language-specific deterministic cleanup. Other explicit languages and Automatic use neutral cleanup, so English assumptions are never applied to another language.

Smart cleanup limitation. Apple’s on-device AI cleanup is unavailable while **Language you speak** is Automatic. Choose explicit English, Spanish, or French if you want that optional feature.

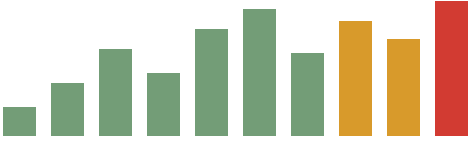

Choose the microphone you actually want Murmure to follow.

MICROPHONE

Ready

INPUT

System default

Test microphone

System default

Follows the current macOS input without changing macOS. This is the safest choice if you regularly switch between built-in, USB, Bluetooth, or display microphones.

Specific device

Keeps the chosen device selected. If it disconnects during capture, Murmure stops safely instead of silently switching the recording to a different microphone.

Bluetooth

Connection quality and microphone mode can affect clarity and latency.

Test first

Watch the meter while speaking. Stop the test before starting normal dictation.

Both the input selector and Play start and finish sounds live in **Settings > Microphone & sounds**.

Speech becomes usable text in a deliberate order.

Raw transcript > Deterministic cleanup > Optional smart cleanup > Snippet >

Dictionary correction

Clean up transcripts

Removes common fillers, handles spoken punctuation, normalizes text, and improves sentence structure using local deterministic rules.

Smart cleanup

Uses Apple's on-device model for optional AI cleanup. It has no network fallback and is available only when the device, OS, model, and explicit language are supported.

What cleanup does not do

- It does not upload audio or transcripts.
- It does not replace the explicit correction and dictionary workflow.
- It does not use English-specific assumptions in Automatic mode.
- It does not change snippet matching: a snippet still requires a complete matching utterance.

Turn it off when exact raw wording matters. Disable Clean up transcripts before legal quoting, code-like strings, or other situations where every recognized token should remain untouched.

Edit selected text without sending it to a server.

- 01 Select editable text in another app. The selection cannot be empty.
- 02 Hold    .
- 03 Speak an instruction such as "make this shorter" or "translate this into French."
- 04 Release the shortcut. Murmure creates a proposal with Apple's on-device model.
- 05 Review and edit the proposal. Choose Replace selected text, Copy proposal, or Cancel.

COMMAND MODE

Local transformation

Original
 The exact selected text remains visible here.

Proposal
 The proposed replacement stays editable until you choose what to do.

Cancel

Copy proposal

Replace selected text

Safety rule. Murmure replaces text only if the current selection still exactly matches the original captured selection. If it changed or the target is no longer writable, replacement is refused and Copy proposal remains available.

Command Mode requires Apple's on-device Foundation Model. Settings explains when the model is unavailable. Selected text and spoken instructions are not added to Murmure history.

Turn one complete spoken phrase into reusable text.

ADD SNIPPET
Local

WHEN I SAY

email signature

WRITE

Best,
Filipe
Studio in the Box

☒ **Enabled**

Use “Voice add”

Say “Voice add,” followed by the complete trigger, such as “Voice add, my address.” You may continue speaking after it; Murmure inserts the snippet and keeps the rest of your sentence. Saying only the exact trigger still works.

Multiline replacements

Line breaks are preserved in the inserted text.

Before dictionary rules

Snippet expansion happens before dictionary correction.

Manage snippets from the main Snippets destination

- **Add** creates a trigger, replacement, and enabled state.
- **Toggle** temporarily disables a snippet without deleting it.
- **Edit** changes the trigger or replacement.
- **Delete** removes the snippet after confirmation.

Validation. Triggers and replacements cannot be empty. Duplicate normalized triggers are rejected so two snippets never compete for the same phrase.

Teach the terms and corrections that matter to you.

Term	Correction
Add a name, product, place, or phrase that exists in your vocabulary. Terms can help bias speech recognition and preserve preferred spelling.	Define what Murmure commonly hears and what it should write instead. Example: cloud code > Claude Code.
Anthropic	TERM EditPauseTrash
cloud code > Claude Code	CORRECTION EditPauseTrash

Dictionary controls

- Search terms and corrections from the top of the Dictionary page.
- Add a new entry with Command-N or Add entry.
- Edit, disable, enable, or delete any row.
- Reveal the plain-text dictionary file from the footer when advanced manual inspection is needed.

Prefer specific corrections. Murmure warns when a trigger looks like an ordinary common word because broad replacements can change text you did not intend to change.

Fix history first. Teach Murmure only when the rule is safe.

CORRECT DICTATION**Nothing saves until confirmation**

MURMURE HEARD

Send it to cloud code tomorrow.

I MEANT

Send it to Claude Code tomorrow.

Remember for future dictations

Rule to remember: "cloud code" > "Claude Code"

Cancel

Save correction

Complete correction workflow

- 01** On a Home history row, choose the pencil Correct action.
- 02** Optionally play the original recording.
- 03** Edit I meant, or choose Dictate to fill the draft with a fresh voice recording.
- 04** Review the suggested rule. Leave Remember on only when the rule is safe.
- 05** Choose Save correction. This is the only action that changes history or the dictionary.

Punctuation-only changes, insertions, deletions, or ambiguous edits may be saved to history without creating a dictionary rule. If the data drive is unavailable, a safe rule can remain pending and retry later.

Every saved recording remains useful.

LOCAL HISTORY

Search your local history

Apple (streaming) / 0.42s

Your saved transcript appears here with its engine, time, and processing duration.

[Play](#)
[Retry](#)
[Edit](#)
[Copy](#)
[Trash](#)

Play

Starts or stops the local saved audio. Starting another row stops the first.

Retranscribe

Runs the saved audio through a selected local engine and shows a preview before replacing history.

Correct

Opens the correction editor and can optionally create a safe dictionary rule.

Copy or delete

Copy sends the transcript to the clipboard. Trash removes the history item.

History status labels

Rows may show Retranscribed locally, Correction saved, Correction saved and remembered, or Correction saved; rule pending.

Search and loading are local. Home renders history in smaller batches as you scroll so a large archive stays responsive. Filtering never sends your query or results to a service.

A failed transcript does not have to mean lost audio.

When recognition or saving fails after recording, Murmure can retain the local audio as a recoverable recording on Home.

RETRANSCRIBE RECORDING

Local engine

RECOVERY STATUS

The speech engine returned no text.

SPEECH ENGINE

Apple (streaming) or Parakeet (batch)

NEW LOCAL TRANSCRIPT

Nothing is saved until you review and confirm this candidate.

Cancel

Save to history

- History retranscription replaces the current history text only after confirmation.
- Recovery retranscription adds the recovered recording to history only after confirmation.
- Parakeet may download its free local model before the first retry.
- If saving fails, the original recording and history remain unchanged.
- Delete one recoverable recording from its row, or delete every recoverable recording with the Home cleanup action.

Your working data stays in the local loop.

Stored locally

Settings, snippets, dictionary entries, transcript history, captured audio, and Command Mode processing remain on the Mac or configured data drive.

Network exceptions

Only one-time local model downloads and optional update checks use the network. There is no cloud transcription or Command Mode fallback.

Storage and automatic cleanup

Settings > Privacy & storage shows the active storage location and lets you keep completed history forever or automatically delete entries older than 1 week, 30 days, 6 months, or 1 year. Delete all history removes it immediately. These controls do not erase Dictionary entries or Snippets.

Diagnostics are sanitized. Preview, copy, or export configuration and permission facts. Reports exclude dictated text, history, audio, snippets, dictionary data, and local paths.

Update safely. Diagnose without exposing your words.

Check for updates

- 01

Open **Settings > Advanced & updates.**
- 02

Choose Check for updates. Murmure checks GitHub Releases and stages a verified archive locally.
- 03

When a newer version is ready and no recording is active, choose Install and relaunch.
- 04

After relaunch, confirm the version number shown in Settings.

Common problems

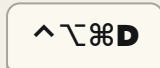

Shortcut does nothing	Confirm Accessibility is Granted. Quit and reopen Murmure after changing the macOS permission.
No audio level	Confirm Microphone is Granted, select System default, then run Test microphone.
No text inserted	Keep an editable field focused. Turn off Compare Mode, which intentionally does not insert text.
Automatic unavailable	Select Parakeet and allow its one-time local model download to finish.
Smart cleanup disabled	Turn on cleanup and choose explicit English, Spanish, or French. Automatic is not supported.
Command Mode unavailable	Check the availability message in Settings. Apple's on-device model is required.
Storage not ready	Reconnect the configured drive if one is used. Do not delete or move the active data folder by hand.

The complete desk-side checklist.

Before dictating

-  Microphone Granted
-  Accessibility Granted
-  Storage Ready
-  Correct engine and Language you speak

Default controls

-  Hold to dictate
-  Hold for Command Mode
-  Finish hands-free
-  Cancel hands-free

Where to find it

HOME

History, recovery, replay, retry, correct, copy, delete

DICTIONARY

Terms and hear-to-write corrections

SNIPPETS

Reusable text triggered by a complete spoken phrase

SETTINGS

Six focused categories: Dictation, Shortcuts, Microphone & sounds, Appearance, Privacy & storage, Advanced & updates

Remember

Display language never changes
Language you speak.

Compare Mode does not type. Say "Voice add" plus a snippet trigger, even inside a longer sentence.

Set history retention under Privacy & storage; dictionary entries and snippets remain separate.

Corrections save only after confirmation.

Command Mode always asks you to review.
